UI/UX DESIGN DOCUMENT

HyrenePortfolio — Personal Portfolio App

Student	Nsabimana Irene
Registration number	25/27790
Institution	INES-Ruhengeri
Programme	Software Engineering
Course	SWE 3409 — Mobile Application Development
Assignment	Assignment 2: My Name Is Personal Portfolio App

Design focus

A simple, readable mobile portfolio that presents identity, education, skills and software projects in one scrollable screen. The interface uses teal and white surfaces, rounded cards and clear section headings.

Prepared using screenshots supplied by the student from the working Android application.

1. Project Overview

HyrenePortfolio is an Android personal portfolio application developed with React Native, Expo and TypeScript. It provides a place to present the student's identity, educational background, skills, profile photograph and project experience. The layout prioritises quick scanning and straightforward editing on a phone.

1.1 Design objectives

• Present the student's name and introduction clearly.

• Organise education, skills and projects into labelled sections.

• Keep a consistent palette, spacing and card style.

• Allow profile editing and camera/gallery photo selection.

• Keep saved portfolio information available offline through local storage.

1.2 Intended users

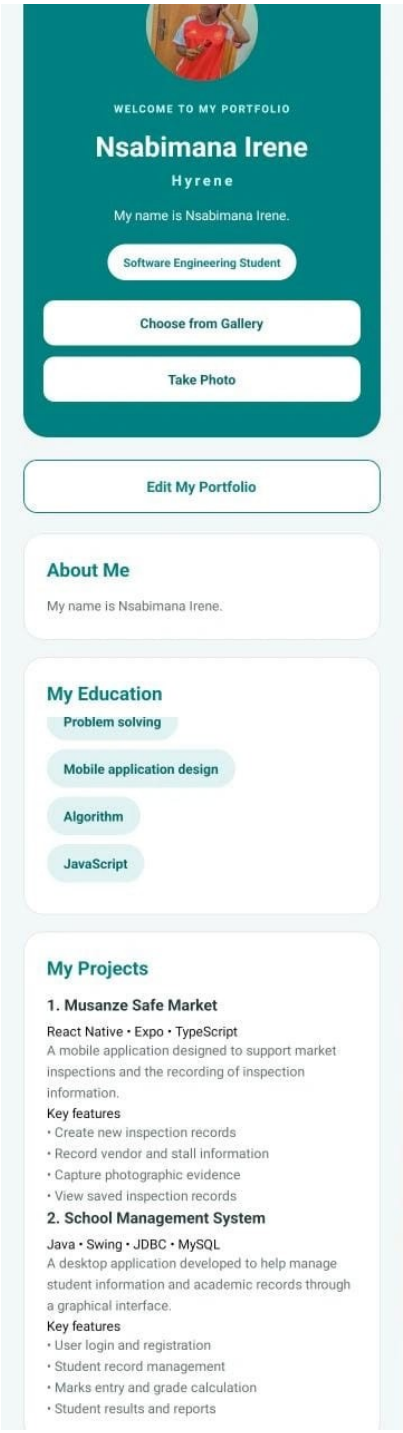

The primary user is a student or early-career developer who wants to maintain a personal portfolio on an Android phone. Secondary viewers may include lecturers, classmates, internship reviewers or people interested in the user's skills and project experience.

1.3 User needs and design response

User need	Design response
Identify the owner	Name, nickname, profile photo and introduction appear in the header.
Review qualifications	Education and skills have separate labelled sections.
Understand experience	Projects include technologies, summaries and key features.
Update personal details	Edit controls, photo actions and local persistence support updates.

2. Interface Design and Screens

The supplied screenshot shows the actual portfolio interface. A teal profile header sits above a light background and white content cards. Rounded corners, whitespace and teal headings separate information into clear sections.

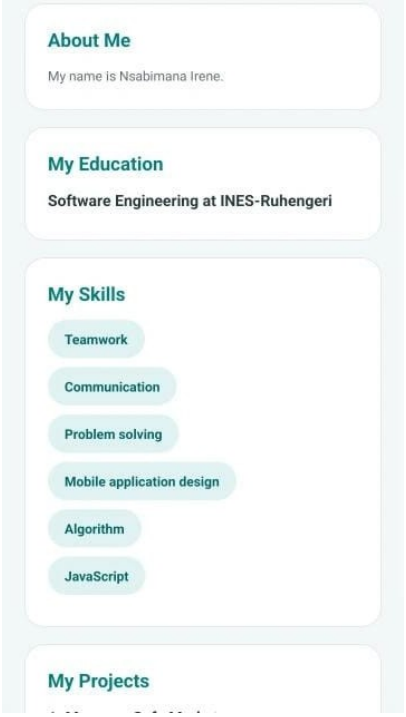

Figure 1. Cropped views from the submitted screenshot: profile and project content (left); skills and project section (right).

2.1 Profile area

The teal header creates a visual starting point. The photograph, name, nickname and introduction establish identity. Gallery and camera actions make the photo editable, while the outlined “Edit My Portfolio” button provides a visible route to updating details.

3. Components, Navigation and Interaction

3.1 Content hierarchy

The screen follows a top-to-bottom order: profile identity, About Me, education, skills and projects. This introduces the person before presenting qualifications and experience. A scrollable layout allows the content to fit on a phone without making the text excessively small.

3.2 Main interface components

Component	Purpose	Design value
Teal header	Highlights identity and photo actions	Clear visual anchor
White rounded cards	Groups related information	Separates content sections
Skill tags	Displays individual skills	Easy to scan
Project descriptions	Explains project technology and features	Makes experience concrete
Buttons	Opens editing or photo actions	Common actions are visible

3.3 Main interactions

• Open the app to view the profile.

• Tap “Edit My Portfolio” to update personal information and skills.

• Choose “Choose from Gallery” to select a photo, or “Take Photo” to capture one.

• Save changes and reopen the app to check persistence.

3.4 Projects shown

Musanze Safe Market: a mobile inspection and record-management project with vendor/stall information, evidence photographs and saved inspection records.

School Management System: a Java desktop project for student records, marks, grades and reports. Both summaries show practical experience with different application types.

4. Visual Design, Accessibility and Evaluation

4.1 Colour and typography

Teal (#008080) is the primary accent, paired with white and light grey surfaces. Dark text supports readability, while teal headings guide the eye through the sections. The limited palette gives the portfolio a consistent and professional appearance.

Role	Colour	Use
Primary accent	#008080 teal	Header, headings and emphasis
Content surface	White	Cards and button surfaces
Page background	Light grey / pale teal	Separates cards from background
Body text	Dark grey	Labels and descriptions

4.2 Usability and accessibility

• Use clear labels such as About Me, My Education, My Skills and My Projects.

• Keep buttons easy to identify and tap.

• Maintain adequate text/background contrast and do not rely on colour alone.

• Use concise descriptions and consistent spacing for mobile reading.

• Check that all content remains reachable by scrolling on the target device.

4.3 Local storage and offline use

Portfolio fields are stored locally with AsyncStorage, and the selected profile image is saved in the app's document storage. This supports access to saved content without a server connection during normal viewing. Camera/gallery actions require the relevant device permissions.

4.4 Evaluation and improvements

The submitted screenshot demonstrates a consistent header, content cards, skill tags and project summaries. The student reported testing profile editing, photo selection/capture, persistence after reopening, offline access and standalone APK operation. Future improvements could include more save-feedback messaging, additional contrast checks and testing on more screen sizes.

5. Conclusion

HyrenePortfolio uses a straightforward mobile layout to present identity, education, skills and project experience. Its teal-and-white theme, labelled cards, visible photo actions and local persistence support a portfolio that is easy to browse and maintain. This document is based on the submitted screenshot and reported application tests.
